

Name : Narendra Kumar S

Date : 06-08-2025

Task:

1. Conference room table with conf room name, seating capacity.

2. tree table with tree names and it's details

Then join them and fetch the values via linq and print the results in console. You can use linqpad

Solution :

Table Creation in SQL

```
create database Room;  
use Room;
```

```
create table conferenceRoom (  
    RoomName varchar(50) primary key,  
    SeatingCapacity int  
);
```

```
create table Tree (  
    RoomName varchar(50),  
    Description varchar(255),  
    foreign key (RoomName) references ConferenceRoom(RoomName)  
);
```

Inserting Records :

```
Insert into conferenceRoom (RoomName, SeatingCapacity) values  
( 'Lotus', 20),  
( 'Tulip', 15),  
( 'Orchid', 25),  
( 'Banayan', 10),  
( 'Coconut', 12);
```

```
Insert into Tree (RoomName, Description) values  
( 'Lotus', 'This room is equipped with projector and AC.'),  
( 'Tulip', 'Ideal for small meetings. AC available.'),  
( 'Orchid', 'Spacious room for large team gatherings.'),  
( 'Banayan', 'Small cozy room with bright interiors.'),  
( 'Coconut', 'Peaceful room with natural lighting and wooden decor.');
```

Linq Query:

```
void Main()
{
    var result = from room in Conferencerooms
                  join tree in Trees on room.RoomName equals tree.RoomName
                  select new
                  {
                      room.RoomName,
                      room.SeatingCapacity,
                      tree.Description
                  };

    result.Dump();
}
```

Output :

▼ Results λ SQL IL+Native Tree AI Forr			
▲ EntityQueryable<> (5 items) ...			
RoomName	SeatingCapacity	Description	
Banayan	10	Small cozy room with bright interiors.	
Coconut	12	Peaceful room with natural lighting and wooden decor.	
Lotus	20	This room is equipped with projector and AC.	
Orchid	25	Spacious room for large team gatherings.	
Tulip	15	Ideal for small meetings. AC available.
